

## Talkspace Senior Fullstack Developer Assignment

### Part 1

I asked chatGPT the following things:

- Build for me a simple booking system with features for creating both standard and anonymous bookings.
- Users can specify details like time, patient, provider, and booking status.
- The application records booking status changes over time, providing a comprehensive status history.
- Additionally, it associates bookings with unused credits and allows users to retrieve their booking history or the timeline of status changes for a specific booking.
- The database should be managed through Sequelize, offering a relational mapping to a MySQL database.
- Please also allow to show the provider some statistic about bookings getting canceled by the client and being rescheduled, and the patient statistic about how many credits he used per month.

The result is [here](#).

**Add code review.**

### Part 2

**Fix the code according to your own comments and send a zip (or a repo link) of the result.**
